**Subject: Quarterly Report No. 11, Second Quarter 2004 Interim Action Full-Scale SVE
System, Boeing Realty Corporation, Former C-6 Facility – Parcel A, Los
Angeles, California**

Haley & Aldrich, Inc. has prepared this technical memorandum to summarize soil vapor extraction (SVE) activities conducted at the former Boeing C-6 Facility (Site), in Los Angeles, California.

This technical memorandum summarizes system operations, field measurements, vapor sampling and analysis, mass removal, extraction well optimization, and planned future SVE activities for the former Building 1/36 area SVE system (Figure 1).

BACKGROUND

Laboratory results for soil samples collected in the former Building 1/36 area at the Site indicated the presence of VOCs at depth, requiring remediation to prevent possible impact to groundwater. Based on the results of the investigations, shallow occurrences of impacted soil (less than 12 feet below ground surface [bgs]) were excavated and disposed of at an approved facility. SVE was recommended for the remediation of deep impacted soil. Haley & Aldrich was contracted by Boeing Realty Corporation (BRC) to first install and operate first an SVE pilot test system, and later a full-scale SVE system. Appropriate work plans for the SVE systems were submitted and approved by the Los Angeles Regional Water Quality Control Board (LARWQCB) in June 2001, and December 2001, respectively.

FORMER BUILDING 1/36 OVERVIEW/CHRONOLOGY

Initial pilot testing commenced in the Building 1/36 area in July 2001, and continued until October 2001, when Site grading began. Due to Site grading conflicts, the SVE pilot test system was removed and the SVE wells were abandoned. At the end of November 2001, one dual-completion well (1-VEW-24A/B) was reinstalled and the pilot test system was restarted on 13 December 2001. An additional 41 dual and single completion wells (1-VEW-1 through 1-VEW-26) were installed during the month of January 2002 as part of the interim action SVE system implementation. The location of the Building 1/36 SVE system is shown in Figure 1. The well field layout, including well screen depths, is shown on Figure 2.

During the second quarter of 2002, the pilot test system was shut down and replaced with a 1,000 standard cubic feet per minute (scfm) SVE system. At this point, the Building 1/36 interim action SVE system consisted of 43 3-inch diameter, single and dual-completion, SVE wells, a trailer-mounted 1,000 scfm blower system, three 8,000-lb granular activated carbon (GAC) vapor control vessels (primary, secondary, and stand-by), and associated piping. Haley & Aldrich began system operation on 15 May 2002.

On 7 June 2002, the system shut down due to apparent vandalism. Exothermic reactions on the GAC beds continued until June 12, when upon discovery, the beds were quenched with water. Due to the GAC bed overheating, system damage occurred that required repair prior to restart. GAC was removed from all three vessels on 13 June 2002.

After evaluating these heat reactions from adsorption of 2-Butanone (MEK), laboratory analysis was used to evaluate the extent of MEK presence in the vadose zone. In March 2003, the installation of a GAC water quench system to control MEK heat generation was completed, and the system was restarted on 11 March 2003. The procedures for restarting the SVE system included bringing the well field online in a phased approach. Throughout this process, flow rates and VOC and MEK concentrations/mass loading rates were closely monitored. These start-up procedures were completed on 15 April 2003, and the system was fully operational until it was temporarily deactivated on 22 May 2003, so that modifications could be made to the South Coast Air Quality Management District (SCAQMD) permit to facilitate greater flexibility in GAC changeout procedures. Once modifications were complete and approved by the SCAQMD, the system was reactivated on 27 June 2003.

During the second half of 2003, the system operated as planned, as wells were added slowly to the influent stream to provide a seven-day carbon changeout frequency. By 25 September 2003, vapors were being extracted from all 43 SVE wells.

At the end of the fourth quarter of 2003, the system was shut down for annual maintenance. Before system restart, early in the first quarter of 2004, diagnostic tests were performed to confirm system operational logic and evaluate the status of alarms, alarm responses, and the calibration of system instrumentation. Diagnostic tests were completed and the system was restarted on 7 January 2004.

Weekly carbon exchange frequency was managed in the first half of 2004 by reducing flow from and/or closing low-VOC wells, and increasing flow from source area wells. System operational uptime for 2004

was relatively high, and optimization of the influent air stream took place weekly. By the end of the second quarter, 29 out of 46 wells were actively under vacuum.

In June 2004, three additional infill SVE wells were installed and piped to the manifold system at the Site. Wells VEW-27, VEW-28, and VEW-29 were screened from 40 to 65 ft bgs, and were installed along the southwest corner of the existing well field. The Building 1/36 interim action SVE system currently consists of 46 single and dual-completion SVE wells.

SECOND QUARTER 2004 BUILDING 1/36 SVE OPERATION SUMMARY

Days of Operations	81
Available Days of Operation	91
Operational Time (%) (1 April to 30 June)	89%
Mass Removed during Period (lbs)	2,015
Cumulative Mass Removed (lbs) (July '01-June '04)	29,459

OPERATIONS INFORMATION

Operational data and VOC mass removal for the SVE unit are tabulated and shown graphically in Attachment 1. During the second quarter, wells located along the perimeter of the VOC plume were closed as field photoionization detector (PID) concentrations measured in these wells approached zero. At the start of the second quarter, all wells were actively under vacuum. By the end of the second quarter, 29 out of 46 wells (including three new SVE wells) were actively under vacuum. Total days of SVE system operation for this period were 81 of 91.

At the end of the first quarter, a momentary loss of signal from a vessel thermocouple caused a brief blower shutdown. The blower was automatically turned off by the system programmable logic controller (PLC) and remained off through the end of March 2004. After an initial investigation, no system malfunctions were discovered. This event reoccurred on 17 May 2004, and caused another blower shutdown. While the vessels were cooled with dilution air, an in-depth investigation took place. After a thorough system diagnostic identified the cause as a voltage irregularity in one of the input boards, appropriate repairs were made, and the entire PLC board was tested. The system was reactivated on 21 May 2004 on partial ambient air dilution, and was fully activated one week later.

On 7 June 2004, three additional infill SVE wells were installed and piped to the system (Figure 2). Wells VEW-27, VEW-28, and VEW-29 were screened from 40 to 65 ft bgs, and were installed along the southwest corner of the existing well field. These wells were installed to accelerate VOC removal and evaluate VOC concentration distributions in this area of the plume prior to Site redevelopment. Data from these wells, along with discussion of the results will be reported in the next quarterly report.

The monthly and cumulative mass of VOCs removed by the Building 1/36 SVE system is shown in Attachment 1, Graph 3. Since 2 July 2001 (initial small-scale pilot test start-up) approximately 29,459 lbs of VOCs have been extracted during approximately 13,157 hours of SVE unit operation. Operation of the SVE system is currently in compliance with the Site-specific permit from the SCAQMD.

FIELD MEASUREMENTS

VOC concentrations were measured with a PID calibrated to 100 parts per million by volume (ppmv) hexane, as per the SCAQMD permit requirements, at the undiluted inlet, diluted inlet, between the GAC vessels, and at the exhaust stack. Flow rates were measured with a direct flow meter or by a hand-held Veloci-Calc[™] meter. Additional measurements were collected during operation, including vacuum readings at each extraction well, temperatures at the GAC vessels, and blower exhaust temperatures. The combined well field influent VOC measurements are provided in Attachment 1, Table I, and plotted in Attachment 1, Graph 2. Field measurements of flow, VOC concentration, and vacuum measured at each well head are provided in Attachment 1, Table III.

VAPOR SAMPLING AND ANALYSIS

For this period, a total of 9 vapor samples were collected from the inlet, mid-point, and exhaust of the process air stream, and were delivered to a state-certified laboratory for analysis. These samples were collected for SCAQMD permit compliance, as well as system performance evaluation. The vapor samples were collected using a Tedlar bag in a vacuum case. Laboratory analyses were conducted on these vapor grab samples using EPA Method 8260B/TO-14A. The laboratory results of the influent vapor sampling are summarized in Attachment 1, Table II.

Based on the results of the laboratory analyses of vapor grab samples, maximum undiluted inlet VOC concentrations in parts per billion by volume (ppbv) for the period are as follows:

■ 2-Butanone (MEK)	60,000 ppbv
■ Toluene	28,000 ppbv
■ 1,1,1-Trichloroethane	24,000 ppbv
■ Acetone	2,100 ppbv
■ Trichloroethene (TCE)	1,800 ppbv
■ Xylene	1,800 ppbv
■ 1,1-Dichloroethene (1,1-DCE)	900 ppbv
■ Ethyl-benzene	240 ppbv
■ 1,1,2-Trichloroethane	88 ppbv

Figure 3 depicts past well field VOC concentrations, as well as more recent field screening results and contours. Well field MEK concentration contours, from December 2002, April 2003, and February 2004 are depicted on Figure 4. The data are included in Attachment 1, Table IV.

EXTRACTION WELL OPTIMIZATION

System optimization activities continued into the second quarter 2004. While adhering to the carbon exchange restraints (targeting scheduled breakthroughs at seven-day intervals), targeted wells were subjected to higher vacuum and flow, while wells located near the perimeter of the plume were operated as circulation wells by opening associated vapor sampling ports. This allowed fresh air to be drawn

through the sample ports into the vadose zone and towards extraction wells that were operating (under vacuum).

VOC concentrations in the SVE wells continue to decline; however, due to system optimization procedures, VOC loading rates remain sufficient to maintain a weekly carbon exchange schedule.

The optimization process continues to successfully reduce the peripheral soil vapor concentrations surrounding the core wells (1-VEW-23B and 1-VEW-21B). At the end of this quarter, 29 of 46 wells are actively under vacuum. Influent concentrations have generally been kept at or below 1,000 ppmv.

ACTIVITIES FOR NEXT QUARTER

During the third quarter of 2004, well optimization adjustments will continue in order to maximize mass removal while balancing the weekly carbon exchange. Since VOC concentrations are expected to continue their decline, it may become difficult to maintain a weekly carbon breakthrough schedule during the third quarter. While optimizing the system, consideration will be given to GAC vessel temperature, safe MEK loading rates, and carbon breakthrough schedule.

Operation of the SVE system may be temporarily discontinued late next quarter to accommodate planned Site redevelopment. These future activities may include some or all of the following:

- Remove the SVE compound;
- Remove above ground piping;
- Protect and bury existing SVE wells;
- Perform Site grading and new building construction; and
- Reinstall SVE system.

Reinstallation of the SVE system is not likely to occur until first quarter 2005; start-up will likely be performed during the second quarter 2005. The schedule for these activities will be dictated by the Site redevelopment and new building construction. The LARWQCB will be kept informed of the redevelopment and SVE system schedule. A 2004 Third Quarter Report summarizing activities during the period July 2004 through September 2004 will be prepared and submitted to BRC in October 2004.

We appreciate the opportunity to provide environmental consulting services on this project. Please do not hesitate to call if you have any questions or comments.

Notes:

- ppmv: parts per million by volume
- scfm: standard cubic foot per minute (acfm corrected for vacuum and temperature)
- NA: Data not available or applicable
- NM: Data not measured
- GAC: granular activated carbon
- * PID Adjusted to FID equivalents as Hexane by multiplying PID Reading by 0.35 (Hexane Equiv = PID Reading x PID CF X FID RF)
- ** Associated hour meter readings are extrapolated from nearest date and time readings with hour reading measurements
- (1) Direct flow readings taken by hand-held TSI Veloci-calc Plus, unless otherwise denoted
- (2) Measurements taken with a Foxboro OVA-108 PID calibrated to 100 ppmv Hexane until August 2003 when changed to MiniRea-2000.
- (3) As of 3/12/03, Field measurements were conducted using a 10.6 eV PID. No correction has been applied.
